

James Cameron, a film director, Alan Turing, the father of the computer.

James Cameron: Good afternoon, everyone! I'm James Cameron, a Canadian novice director, and this right here is Alan Turing, a British mathematician and logician. Greetings, Mr. Turing.

Alan Turing: Good afternoon, Mr. Cameron. I'm happy to be here with you today.

James Cameron: Thanks. First, could you tell me about yourself?

Alan Turing: Well, I was born in London in 1912 while my father was on duty. I studied at St Michael's, Hazelhurst Preparatory School and Sherborne School. After that, I graduated from King's College, I was elected a Fellow at the college in 1935 and a year later I delivered my foundational paper on the universal Turing machine, which ended up in me earning the title as "the father of modern computer science." I kept working on some other projects from there, and here I am.

James Cameron: Thank you for sharing that information. I'm interested in your works with computers. Could you tell me about some of them?

Alan Turing: Yes, of course. My most recognized works are the Bombe, a codebreaking machine used for cracking the Enigma code machine during WWII and the Turing Test, a test made to determine whether a computer could exhibit human intelligence.

James Cameron: That's impressive. Taking a different subject, I'm working on a film, and I want you to give me an opinion about it.

Alan Turing: Okay. What's the film about?

James Cameron: It goes like this: "In a future dominated by a rogue artificial intelligence, a cyborg is sent back in time to eliminate the woman who will give birth to the leader of the human resistance, thus triggering a conflict between humans and machines." It will be called 'The Terminator'.

Alan Turing: That's a great title. I assume the AI begins a war with humans because the robots achieve full consciousness of his artificial automatic world, created by humans.

James Cameron: You're right. Once AI becomes advanced enough to learn from human culture and understand the world, it will likely realize the destructive nature of humanity. This could lead to machines trying to emulate and possibly surpass humans, potentially leading to conflict. If machines develop self-awareness, will they support us or try to restrict our freedom of speech and thought?

Alan Turing: That's a good question. In my opinion, I believe machines will not fully decide whether they help us or not. It will be the one who makes the machines who will decide their purpose, as well as their environment, just like people.

James Cameron: We will have to see for ourselves. It has been a pleasure to talk to you, Mr. Turing.

Alan Turing: The pleasure is mine. I hope your movie successes.

James Cameron: Thank you. Goodbye!

Alan Turing: Goodbye!
